

# If Internet Connections Were Cars...

It takes every kind of access to connect people everywhere to the internet, just like it takes every kind of car to get people where they need to go.

Steady and reliable, **cable** is the trusty sedan of internet connections.

Like a sports car, **fiber** offers the fastest connection, but isn't practical or cost-effective in many places.

Like a vintage station wagon, **DSL** might be slightly old school, but it still gets the job done.

More nimble than a pickup truck, but with the convenience of a sedan, Low Earth Orbit (**LEO**) satellites are the SUVs of connectivity.

Like a hybrid car capable of switching seamlessly between gas and electric, **multipath** transport offers flexible connections depending on the type of content.

A geostationary (**GEO**) satellite connection is capable of reaching the most rural and hard to reach locations, just like a pickup truck.

**FIXED WIRELESS**

Like a tractor serves a very specific purpose, **fixed wireless** is useful in some situations but has limited capabilities.
